

Week 9 Reflection: Weeks 6-8

Name

- **Angel Bautista**

Project Or App Name

- **Angel's Movie Archive**

Part 1: Development Process

Describe how you moved from story or app idea into folders, files, documentation, JSON, and testing.

- **Well, I was actually shopping for DVDs because there was a huge Criterion collection sale going on at Barnes & Noble, and I had forgotten if I already owned a film or not. I later started working on week #6-7 HW and had the idea: hey, I need a system to figure out which movies I already own; this would be a perfect time to learn how to make one. I thought since we were already organizing things in a file system it would be simple. Following instructions was easy, and my project didn't take much work either. I watched a couple of YouTube videos and understood the coding a bit more, including how to actually do it, too. The biggest issue I had was organizing GITHUB.**

Part 2: Querying And Research

List at least three things you searched, asked, watched, tested, or read.

- **Used this video to understand how to get text files**
 - **<https://www.youtube.com/watch?v=3Ej4VtUPFzw>**
- **I asked my peers how they structured their assignment.**
- **I watched the videos provided by the prof. Stalbert**

Part 3: Code Does Not Live Alone

Explain how code connects to soft skills, hard skills, collaboration, machines, documentation, and communication.

- **I learned that code is not just about making the app work, because I also had to explain what I made and document everything clearly. I struggled with GitHub at first because it was new to me, especially figuring out how to organize and show my project the right way. For my app, I used hard skills like VB.NET, JSON, files, and**

functions, but I also had to use communication skills through comments, screenshots, and a README

Part 4: What I Would Change

If you could redo Weeks 6-8, what would you organize, document, ask, test, or submit differently?

- **I think I did pretty well for a first time. I think I would try to stress less and figure out how to organize things on GITHUB first. What helped me most was looking at the structure and examples my peers had.**

Part 5: Week 9 Coding Practice

Explain both required coding pathways.

Pathway A: Text Starter Code

Explain what the provided starter code does after you get it running in Visual Studio.

- **It wasn't working at first because the JSON file wasn't installed in the project yet so it wasn't running properly until I installed the JSON.**
- **Array used: Story Choices**
- **Loop used to display choices: For...Next**
- **Loop used to repeat the program: Do...While Loop**
- **Three choices I changed: The Names of the options; I gave the 4 options the names of the Beatles. John, George, Paul, Ringo**

Pathway B: Video Tutorial

Explain what you built by following the VB.NET loops video.

- **Project from the video: WPF App that generates random numbers**
- **Loop or loops used: Do While...Loop**
- **My small personal change: I added "DELETED" to appear after hitting clear.**
- **Screenshot location: Week 9 Screenshots Pathway B 3 of 4**

Part 6: Git Submission Map

Your root README must explain where the instructor can find every item you want graded.

- **Reflection location: # Week 9 Reflection: Weeks 6-8**
- **Query log location: Query Log Builder**

- **Pathway A text starter project location: Week9_TextStarter_LoopsArrays**
- **Pathway B video tutorial project location: Pathway B Video Lesson**
- **Screenshots location: Week 9 Screenshots**
- **Discord proof location: Discord Proof**
- **Assets or libraries location: Assets or libraries**
- **README location: ReadMe.**
